SCANNER**

PALIDIN.ONE

Global ID Document Authentication

HOW DOES IT WORK?

Traditional ID scanners are connected to a PC to handle the software for identifying and verifying the data and images on a customer's ID.

PALIDIN.ONE's system is cloud-based, capturing data via Optical Character Recognition (OCR) as well as taking visible white light, infrared, and ultraviolet images. The data is encrypted and processed in secure servers.

REAL-TIME VERIFICATION OF GLOBAL IDs

Government issued Drivers Licenses, IDs, and Passports are verified in real-time.

The authenticity of the ID documents and their expiration date are verified in a few seconds and the results are presented directly on the scanner itself.

The system is completely self-contained.
No PC, no screen, just Plug-n-Scan.

EASY TO USE

The **PALIDIN.ONE** scanner only requires power and a wired or wireless internet connection.

The scanner automatically connects to the ID document library, which makes it easy for new users to get started right away. No training is required to be able to scan or use the system.
